Whooping Cough

Infants and Babies Can Be Deadly for Whooping Cough

What Do You Mean You Didn’t Get Vaccinated Against Whooping Cough?

NYC健康

Toga County Public Health

Whooping Cough Prevention

Infected cases seem to stop breathing and turn blue.

Many babies with pertussis don’t cough at all and:

Exposure to whooping cough after being infected

The traditional symptoms of pertussis may appear:

After 1 to 2 weeks and as disease progresses:

• Pale or green in breathing (in babies)
• Mild, occasional cough
• Low-grade fever
• Runny nose

Early symptoms can last for 1 to 2 weeks and can

What is Whooping Cough?
Pregnant Women

Each of their pregnancies:

- Pregnant women should get a Tdap during the third trimester (between weeks 27 - 36 weeks) during
- Vaccination during the third trimester

Grandparents

You play an essential part in your grandchildren’s life and health. Babes in arms need a 2nd

You were vaccinated...

If you get Pertussis even though

In order to help keep them safe,

- Like many other diseases, babies rely on
- Everyone to be vaccinated against
- The percentage of children with long pauses
- Coughing fits, whooping cough, and vomiting
- In most cases, the cough won’t last as long
- In cases where it does last longer, it is less severe
- Due to lack of oxygen, vomiting is less
- In breathing, the pertussis cough can

Between 11 - 12 years old,

against pertussis (Tdap)

Children need a 6th vaccine.

Need treatment in the hospital

Approximately half of babies less

1 year old who get pertussis
